1.0 Introduction

1.1 General

This instruction manual provides a description of the AirSep RELIANT Pressure Swing Adsorption (PSA) Oxygen Concentrator as well as instructions for its installation, operation, and maintenance. Pertinent drawings and component information are also included.

To ensure safe operation and proper system maintenance, AirSep Corporation recommends that you keep this instruction manual readily available for reference.

1.2 Warnings, Cautions, and Notes

As you read the instruction manual, pay special attention to the Warning, Caution, and Note messages. They identify safety guidelines or other important information as follows:

- **WARNING**
  Provides information that can prevent severe bodily injury or death.

- **CAUTION**
  Provides information that can prevent minor bodily injury or property damage.

- **NOTE**
  Provides information important enough to emphasize or repeat.
2.0 Safety

2.1 General

Oxygen, the most abundant of the elements, makes up about 50 percent of the earth's crust. In its free state, it forms about one-fifth of our air by volume. Although oxygen is classified as a non-flammable gas, it supports combustion. As an active element, it combines directly or indirectly with all elements except the rare gases. It is an invisible gas that is colorless, odorless, and tasteless.

To ensure your safety, thoroughly read and familiarize yourself with this Safety Precautions section. AirSep Corporation strongly recommends that you review this section periodically.

2.2 Potential Hazards

Before you attempt to install, operate, or repair the RELIANT Oxygen Concentrator, read and thoroughly understand this instruction manual. Improper operation can result in severe bodily injury, damage to the system, or poor performance.

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
</table>

The design of the RELIANT Oxygen Concentrator allows for use under the direction of a qualified, licensed physician. An alternate source of oxygen must be available if a power failure or equipment malfunction occurs.

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
</table>

Take extreme care to keep all oxygen piping and vessels clean. To avoid a fire or an explosion, oxygen clean all surfaces that can come in contact with oxygen. Check all oxygen fittings/joints for leaks with an oxygen-compatible leak-detecting solution.
Oxygen vigorously accelerates the burning of combustible materials. In an oxygen-enriched atmosphere, many materials that do not burn in normal air require only a slight spark or moderate heat to set them aflame.

To avoid a fire or an explosion, keep gasoline, kerosene, oil, grease, cotton fibers, paint, and any other combustible material away from any part of the RELIANT Oxygen Concentrator or optional auxiliary oxygen receiver.

Do not smoke or use an open flame near the oxygen concentrator or optional auxiliary oxygen receiver.

Post "NO SMOKING OR OPEN FLAMES" signs in the area where the oxygen concentrator and optional auxiliary oxygen receiver are located. AirSep STRONGLY recommends that only individuals trained and experienced in the safe handling of oxygen operate this system.

Electrical shock hazard. The interior of the RELIANT Oxygen Concentrator contains electrical parts that can produce an electrical hazard if not handled properly. To prevent electrical shock, read and thoroughly understand the Troubleshooting section of this instruction manual before you service the system.

Connect the oxygen concentrator power cord to a properly grounded wall outlet on a circuit that cannot be accidentally turned off. Do not use extension cords.

To prevent fire or electrical shock, locate the oxygen concentrator and the auxiliary oxygen receiver (if supplied) indoors away from rain or any other type of moisture.
2.3 Safety Publications

This section is not a complete summary of required safety procedures. Review the following publications for additional information on the safe handling of oxygen:

- "Installation of Bulk Oxygen Systems at Consumer Sites;" NFPA No. 50; National Fire Protection Association; 1 Batterymarch Park; P. O. Box 9101; Quincy, Massachusetts 02269-9101 USA.

- "Oxygen;" Pamphlet G-4; Compressed Gas Association; 1725 Jefferson Davis Highway; Arlington, Virginia 22202-4102 USA.

- "Cleaning Equipment For Oxygen Service," Pamphlet G-4.1; Compressed Gas Association; 1725 Jefferson Davis Highway; Arlington, Virginia 22202-4102 USA.
3.0 General Information

The design of the RELIANT Oxygen Concentrator allows for use under the direction of a qualified, licensed physician. An alternate source of oxygen must be available if a power failure or equipment malfunction occurs.

3.1 Product Warranty

AirSep Corporation warrants the RELIANT PSA Oxygen Concentrator to be free from defect in parts and workmanship for one year (or otherwise as specified on the original invoice provided) from the invoice date to the original purchaser. AirSep’s obligations under this warranty are limited to the repair (all parts and labor free of charge, excluding filter elements) or replacement of any such concentrator (or part thereof) shown to be defective or, at AirSep's option, to refunding the purchase price of any such system.

Each concentrator for which a warranty claim is asserted shall, at the request of AirSep, be returned freight prepaid with proof of purchase date to the AirSep Factory at the expense of the purchaser. Any replacement component(s) shall be warranted as stated above for the unexpired portion of the original one-year (or otherwise specified) warranty. This warranty does not extend to any concentrator or part if a defect or malfunction occurs from misuse (at AirSep's sole determination), accident, improper filter maintenance,¹ or external causes.² The warranty shall be null, void, and inoperative if the concentrator has been repaired or altered outside of the AirSep Factory without the express prior written authorization of AirSep.

¹ Clean the oxygen concentrator air intake filter every seven (7) days, the compressor intake filter every six (6) months, and replace the coalescing filter element every twelve (12) months according to the instructions within this manual. Failure to clean the intake filters and replace the coalescing filter element on schedule results in a void AirSep Product Warranty.

² Locate the oxygen concentrator in a well-ventilated, climate controlled area that is protected from the weather elements and remains between 40°F (4°C) and 80°F (26°C) to prevent damage not covered under the AirSep Product Warranty. Provide proper voltage to the oxygen concentrator (120 VAC ±10% or 220 VAC ±10%) to prevent damage not covered under the AirSep Product Warranty.
The foregoing warranty is in lieu of any other warranty, expressed or implied, in fact or in law, including without limitation the warranty of merchantability or the warranty of fitness for a particular purpose. It is expressly understood that purchaser’s sole and exclusive remedy for defect in parts is limited to enforcement of AirSep’s obligation as set forth above, and AirSep shall not be liable to the purchaser or others for loss of use of the concentrator or for other special, indirect, incidental, or consequential damages.

Notwithstanding anything to the contrary herein, during the product warranty period, as specified above, AirSep will return repaired concentrators freight prepaid. After the product warranty has expired, the customer is responsible for freight charges both ways. Said warranty shall extend and apply to the concentrator only while the system is owned and used exclusively by the original purchaser.

### 3.2 Limits of Liability

AirSep Corporation shall not be liable for any special, indirect, incidental, or consequential damages that result from the use or malfunction of the RELIANT PSA Oxygen Concentrator or any of its components.

The design of the concentrator allows for use under the direction of a qualified, licensed physician. An alternate source of oxygen must be available if a power failure or equipment malfunction occurs.

### 3.3 Returning the Concentrator or a Component for Service

Follow the procedure below to return the RELIANT Oxygen Concentrator or a component for service or credit:

1. Obtain a Return Goods Authorization (RGA) number from the AirSep Industrial Service Department. **Before you call, have the following information readily available** (noted on the Ownership Data page in the front of this instruction manual):
   - Concentrator Model
   - Concentrator Serial Number
   - Hours of Use (See Hour Meter on Control Panel)
   - Invoice Date

AirSep issues no credit for any warranted item until you present the model number, serial number, and invoice date of the oxygen concentrator.
Write the RGA number clearly on the outside of the shipping container.

![NOTE]

AirSep accepts no item(s) for service or credit unless prior written authorization was issued by AirSep.

Return item(s) in their original packaging material. Be sure to pack merchandise for a safe return. AirSep assumes no responsibility for damage that occurs in transit. Any damage that occurs to the oxygen concentrator or a component because of failure to follow this procedure is the sole responsibility of the customer.

![NOTE]

Return item(s) on a freight prepaid basis only.
4.0 Specifications

**Oxygen Output:**
- 17 SCFH at 0-50 psig* (0-3.4 atm) (0-3.4 bars) at 120 VAC ±10%, 60 Hz or 220 VAC ±10%, 50 Hz
- .45 Nm³/hr at 0-345 kPa** at 120 VAC ±10%, 60 Hz or 220 VAC ±10%, 50 Hz
- 8 slpm at 0-345 kPa*** at 120 VAC ±10%, 60 Hz or 220 VAC ±10%, 50 Hz

**Dew Point:**
- -100°F
- -73°C

**Oxygen Purity:**
- 93-95% at 1-10 SCFH*
- 93-95% at .03-.26 Nm³/hr**
- 93-95% at 1-5 slpm***

- 90% ±3% at 11-17 SCFH*
- 90% ±3% at .29-.45 Nm³/hr**
- 90% ±3% at 6-8 slpm***

**Response Time:**
Requires 20-30 minutes (4 hours with the optional 60 U.S. gal [227 l] receiver) to achieve maximum purity after initial start-up or extended shutdown.

**Sound Level:**
58 dB(A) at 1 m, open field conditions

**Dimensions:**
22.5 x 24.5 x 36.25 in. (W x D x H)
57.2 x 62.3 x 92.1 cm (W x D x H)

**Weight:**
175 lb
80 kg

**Power Requirements (±10%):**
- 120 VAC, 60 Hz, Single Phase, 6 A
- 220 VAC, 50 Hz, Single Phase, 3 A

**Auxiliary Oxygen Receiver Specifications (If Supplied):**
- 60 U.S. gal
- 227 l

24 x 51.75 in. (Dia x H), 4 (ea) bolt hole centers at 23.75 in.
61 x 131.5 cm (Dia x H), 4 (ea) bolt hole centers at 60.4 cm.
150 lb
68 kg

* SCFH (standard cubic foot) gas measured at 1 atmosphere and 70°F.
** Nm³ (normal cubic meters) gas measured at 1 atmosphere and 0°C.
*** slpm (liter per minute) gas measured at 1 atmosphere and 70°F.
5.0 Controls, Parts, and Connections

5.1 Oxygen Concentrator Controls and Indicators

See Figure 1 for the location of the controls described below:

ON/OFF (Power) Switch
The ON/OFF switch starts and stops the operation of the oxygen concentrator. When you supply power to the system, the switch's green indicator light turns on. It remains lit whether the switch is in the ON or OFF position.

AUTO/MANUAL Switch
The AUTO/MANUAL switch includes an amber indicator light. In the AUTO position, the concentrator cycles on and off to meet oxygen demand. In the MANUAL position, the concentrator cycles continuously. The concentrator produces oxygen only while the amber light is lit.

Hour Meter
The hour meter indicates the total number of hours the concentrator has cycled.

Circuit Breaker Reset Button
Used to reset the RELIANT after an electrical overload shutdown.

Oxygen Monitor Light (Optional)
If the unit has an oxygen monitor, the oxygen monitor light turns on if the concentrator does not maintain proper oxygen purity.

Oxygen Regulator
The OXYGEN REGULATOR controls the delivery pressure of oxygen produced by the concentrator.

OXYGEN RECEIVER PRESSURE Gauge
The OXYGEN RECEIVER PRESSURE gauge indicates the pressure of oxygen in the receiver(s).

OXYGEN DELIVERY PRESSURE Gauge
The OXYGEN DELIVERY PRESSURE gauge indicates the pressure of oxygen currently in use.
5.2 Oxygen Concentrator Parts

Adsorbers
The adsorbers contain the molecular sieve that adsorbs (attracts) nitrogen from compressed air and allows oxygen to pass through as product gas.

Oxygen Receiver
The oxygen receiver stores oxygen produced by the oxygen concentrator. It also provides stable flow and purity for short-term surges of oxygen that exceed the rated capacity of the oxygen concentrator. It is located on a shelf inside the unit.

Coalescing Filter
The coalescing filter serves as a bacteria filter and removes any bacteria present in the oxygen supply. This filter is attached to the back of the control panel.

Cabinet Fan
The cabinet fan provides internal cooling for the air compressor. It is found inside the unit on the bottom left hand side.

Compressor Intake Filter
This filter provides additional filtration for the air as it enters the air compressor. This filter is attached to the gray PVC pipe between the oxygen receiver and the front of the unit.

Air Intake Filter
Located on the left side panel, the air intake filter removes any foreign particles from the air that enters the oxygen concentrator cabinet.
5.3 Auxiliary Oxygen Receiver Parts (Optional)

See Figure 2 for the location of the parts described below:

**Auxiliary Oxygen Receiver**

The auxiliary oxygen receiver stores oxygen produced by the oxygen concentrator. It also provides stable flow for longer term surges of oxygen that exceed the rated capacity of the oxygen concentrator. It serves to increase the oxygen surge capacity of the oxygen receiver within the oxygen concentrator.

**Auxiliary Receiver Supply Valve**

The auxiliary receiver supply valve limits the amount of flow to the auxiliary receiver during purge.

**Oxygen Purge Ball Valve**

During initial startup or after an extended shutdown, the auxiliary oxygen receiver is filled with air or low purity oxygen. The oxygen purge ball valve allows low purity oxygen to be vented out of the auxiliary oxygen receiver while it is being purged.

**Oxygen Isolation Ball Valve Assembly**

The oxygen isolation ball valve stops the flow of oxygen to the auxiliary oxygen receiver during troubleshooting. The oxygen safety valve prevents excess pressure from building in the auxiliary oxygen receiver if a system malfunction occurs.

![Figure 2. Auxiliary Oxygen Receiver Parts](image-url)
5.4 Connections

See Figure 3 for the location of the parts described below:

**Auxiliary Oxygen Receiver Outlet**

A chrome demand valve allows oxygen to flow between the auxiliary oxygen receiver and the concentrator.

**Auxiliary Oxygen Receiver Supply Valve Assembly**

This is connected to the auxiliary oxygen receiver outlet and limits the amount of flow to the auxiliary receiver during purge. A green hose connects to the ¼” MPT x B size fitting of the assembly. The other end of the hose connects to the oxygen isolation ball valve assembly.

**Main Oxygen Outlet**

A green oxygen hose connects this 1/4-inch MPT x "B" size oxygen demand valve to the ball valve assembly.

**Primary Oxygen Ball Valve**

The primary oxygen ball valve controls the flow of oxygen from the oxygen concentrator to your oxygen distribution system.

**Secondary Oxygen Ball Valve**

The secondary oxygen ball valve controls the flow of a backup source of oxygen to your oxygen distribution system. This ball valve should always be closed unless a backup source is connected to it.

**Center Fitting**

This 1/4-inch MPT fitting connects the RELIANT and a backup oxygen source to your oxygen distribution system.

**Power Cord**

This power cord and its grounded electrical plug supply power to the RELIANT when connected to an electrical outlet.
Figure 3. Auxiliary Oxygen Receiver Connections
6.0 Installation

6.1 Unpacking

AirSep Corporation ships RELIANT Oxygen Concentrators on a wooden skid covered with corrugated cardboard. This container includes an accessory kit with an instruction manual and all the items necessary to properly install the oxygen concentrator. The auxiliary oxygen receiver (if supplied) is shipped separately.

AirSep recommends that you follow these unpacking guidelines carefully to protect yourself against loss from any damage caused during shipment.

1. Make sure the container is delivered right side up, and inspect the exterior for damage. If you observe any damage, note it on the freight bill or the express receipt before you sign it.

   NOTE
   Failure to note exterior damage on the freight bill or the express receipt at the time of delivery can result in the carrier's refusal of a damage claim.

2. Carefully cut and remove any banding straps from the container. Then remove the corrugated cardboard.

   NOTE
   Remove the corrugated cardboard very carefully. You may need to return the oxygen concentrator if it was damaged during shipment.

3. Remove the oxygen concentrator from the wooden skid.

4. Remove a side panel from the concentrator and remove the white piece of foam under the compressor.

5. Thoroughly inspect the oxygen concentrator interior and exterior for damage caused during shipment. Pay special attention to the cabinet (especially the bottom), switches, gauges, brackets, etc. Replace the side panel on the concentrator.

6. Remove the accessory kit, and place the oxygen concentrator near the inlet of your oxygen distribution system.
7. Unpack the accessory kit, and inspect the contents for damage.

Refer to Appendix B for the contents of accessory and spare parts kits.

8. Although the RELIANT is carefully inspected, tested, and packed, it can be damaged during shipment due to improper handling. If you find any concealed damage (loss or damage not found until the concentrator is unpacked), immediately call the delivery carrier and file a concealed-damage claim. Keep ALL container material and interior packing for the carrier's inspection.

YOU MUST MAKE A CONCEALED-DAMAGE CLAIM WITHIN 24 HOURS OF DELIVERY. Only the consignee can file this claim.

Follow these unpacking guidelines carefully to protect yourself against loss from any damage caused during shipment.
6.2 Pre-Installation Guidelines

Before you install your AirSep RELIANT PSA Oxygen Concentrator, review the following: ambient temperature, floor space, feed air, and power guidelines.

6.2.1 Ambient Temperature

Locate the oxygen concentrator in a well-ventilated, climate controlled area that is protected from direct sunlight and remains between 40°F (4°C) and 100°F (38°C) to prevent damage not covered under the AirSep Product Warranty.

6.2.2 Physical Specifications

RELIANT Oxygen Concentrator

Floor Space: 34.5 x 36.5 x 48.25 in. (W x D x H)  
87.7 x 92.8 x 122.6 cm (W x D x H)*  

* Includes a minimum 6-inch (15.3-cm) clearance on all sides.

60 U.S. gal (227 l) Auxiliary Oxygen Receiver (if supplied)

Floor Space: 24 x 51.75 in. (Dia x H)  
61 x 131.5 cm (Dia x H)

6.2.3 Power Supply

120 VAC ±10%, 60 Hz, Single Phase, 6 A  
or  
220 VAC ±10%, 50 Hz, Single Phase, 3 A  

Locate an available grounded electrical outlet on a circuit that cannot be accidentally turned off and cause the oxygen concentrator to stop cycling. If power is off but oxygen is in use, the auxiliary oxygen receiver depressurizes. Repressurization of a 60 U.S. gal (227 l) auxiliary oxygen receiver requires approximately 4 hours.

A backup source of oxygen must be available if a power failure or system malfunction occurs.
6.3 Installation Instructions

To assure proper installation and safe operation of your RELIANT PSA Oxygen Concentrator, AirSep Corporation recommends that you review this entire section before you attempt to install the unit. Figure 4 shows a typical installation setup which includes an auxiliary oxygen receiver. Figure 5 shows a typical setup without an auxiliary oxygen receiver.

- **WARNING**
  
  Do not turn off power to any component unless you are sure the medical facility does not require any oxygen, or there is a sufficient alternative/backup source of oxygen.

- **WARNING**
  
  Before you attempt to install, operate, or repair the oxygen concentrator, read and thoroughly understand this instruction manual. Improper operation can result in severe bodily injury, damage to the system, or poor performance.

- **NOTE**
  
  Do not plug in the power cord until you complete the installation of the oxygen concentrator.

- **CAUTION**
  
  Provide proper voltage to the oxygen concentrator (120 VAC ±10% or 220 VAC ±10%) to prevent damage not covered under the AirSep Product Warranty.

- **WARNING**
  
  Connect the oxygen concentrator power cord only to a properly grounded electrical outlet on a circuit that cannot be accidentally turned off. Do not use extension cords.
Figure 4. Typical Installation Setup with Auxiliary Oxygen Receiver

Figure 5. Typical Installation Setup without Auxiliary Oxygen Receiver
1. Move the oxygen concentrator and optional auxiliary oxygen receiver into place near the inlet of your oxygen distribution system. Locate the unit away from curtains or drapes, hot air registers, radiators, heaters, etc. Allow a minimum 6-in. (15.3-cm) clearance on all sides of the oxygen concentrator.

To prevent fire or electrical shock, locate the oxygen concentrator and the auxiliary oxygen receiver (if supplied) indoors away from rain or any other type of moisture.

Locate the oxygen concentrator in a well-ventilated, climate controlled area that is protected from direct sunlight and remains between 40°F (4°C) and 100°F (38°C) to prevent damage not covered under the AirSep Product Warranty.

Do not plug in the power cord of the oxygen concentrator at this time.

Perform steps 2, 3, and 4 only if the system includes a 60 U.S. gal (227 l) auxiliary oxygen receiver.

2. Connect the oxygen isolation ball valve assembly to the auxiliary oxygen receiver inlet port (bottom port) and tighten.

3. Connect the auxiliary oxygen receiver supply valve assembly to the auxiliary oxygen receiver outlet of the concentrator.
Take extreme care to keep all oxygen piping and vessels clean. To avoid a fire or an explosion, oxygen clean all surfaces that can come in contact with oxygen. Check all fittings/joints for leaks with an oxygen-compatible leak-detecting solution.

4. Connect one end of the 7-ft (2.1-m) green oxygen hose to the auxiliary oxygen receiver supply valve assembly and the other end to the oxygen isolation ball valve assembly. Tighten both fittings.

5. Connect the center fitting of the oxygen ball valve assembly to your oxygen distribution system. Close the primary and secondary ball valves.

6. Connect one end of the 4-ft (1.2-m) green oxygen hose to the primary ball valve on the oxygen ball valve assembly, and tighten.

7. Connect the other end of the 4-ft (1.2-m) green oxygen hose to the oxygen concentrator MAIN OXYGEN OUTLET.

8. Connect a backup source of oxygen to the secondary ball valve on the oxygen ball valve assembly, and tighten.

9. Make sure that the secondary ball valve is closed.
7.0 Operation

7.1 Initial Start-Up

Before you attempt to install, operate, or repair the RELIANT Oxygen Concentrator, read and thoroughly understand this instruction manual. Improper operation can result in severe bodily injury, damage to the system, or poor performance.

Oxygen vigorously accelerates the burning of combustible materials. In an oxygen-enriched atmosphere, many materials that do not burn in normal air require only a slight spark or moderate heat to set them aflame.

To avoid a fire or an explosion, keep gasoline, kerosene, oil, grease, cotton fibers, paint, and any other combustible material away from any part of the oxygen concentrator.

Do not smoke or use any open flame near the oxygen concentrator or oxygen receiver.

Post "NO SMOKING OR OPEN FLAMES" signs in the area where the components are located. AirSep STRONGLY recommends that only individuals trained and experienced in the safe handling of oxygen operate this system.

The design of the RELIANT Oxygen Concentrator allows for use under the direction of a qualified, licensed physician. A backup source of oxygen must be available if a power failure or system malfunction occurs.
Before the RELIANT can supply oxygen within purity specifications, you must purge all air from the oxygen receiver(s).

Provide proper voltage to the oxygen concentrator (120 VAC ±10% or 220 VAC ±10%) to prevent damage not covered under the AirSep Product Warranty.

When you turn the oxygen concentrator on for the first time, it can take 20-30 minutes for oxygen purity to reach specification (4 hours if the auxiliary receiver is used).

1. Observe that the ON/OFF switch is in the off position.

Connect the oxygen concentrator power cord to a properly grounded electrical outlet on a circuit that cannot be accidentally turned off. Do not use extension cords.

2. Insert the plug into a grounded electrical outlet. (Refer to Section 6.2.3 for power guidelines.)

3. Observe that the ON/OFF switch’s green power light is on.

If the power light is off, first check the electrical connection and then the oxygen concentrator circuit breaker. If this condition still exists, refer to the Troubleshooting section.

4. Set the AUTO/MANUAL switch to the MANUAL position.
If the unit is equipped with an oxygen monitor, the oxygen monitor light on the control panel remains on until the oxygen purity reaches 85% ±3%. The oxygen monitor alarms intermittently after 15 minutes if the RELIANT does not reach proper oxygen purity. During start-up, this alarm is silenced for 30 minutes.

Air exhausts for 3-5 seconds from the compressor relief valve. This is normal. It removes any pressure that builds up inside the compressor to ensure easy start-up.

Perform the following steps only if the auxiliary oxygen receiver is used.

1. Close the primary oxygen supply valve.
2. Open the ball valve on the oxygen isolation ball valve assembly.
3. Close the auxiliary oxygen receiver supply valve.
4. Open the oxygen purge ball valve on the auxiliary oxygen receiver.
5. Ensure that the AUTO/MANUAL switch is set to MANUAL and turn the unit on.
6. After 1.5 hours, close the oxygen purge ball valve.
7. After an additional 2.5 hours, open the auxiliary receiver supply valve.
8. Set oxygen regulator to 50 psig.
9. Open the primary oxygen supply valve.
10. Set your flow meter to 8 LPM and allow the unit to run for 15 minutes.
11. Set flowmeter(s) to desired flow and set the AUTO/MANUAL switch to AUTO.

There is a small hole drilled in the ball valve to allow a controlled amount of gas to flow into the tank receiver when the valve is in the closed position. Figure 6 illustrates the opened and closed position of this valve.
If Reliant supplies oxygen to more than one location, a flowmeter calibrated to 50 PSIG must be used at each location. The total flow out of all locations must not exceed 8.0 LPM.
At the time of initial start-up, and periodically thereafter, check all external fittings/pipe joints for leaks using an oxygen-compatible leak-detecting solution.

Use an oxygen analyzer (if available) to sample the oxygen purity to verify it is within specification.

7.2 Normal Start-Up

1. Make sure the AUTO/MANUAL switch is in the AUTO position and the ON/OFF switch’s green power light is on
2. Set the ON/OFF switch to the ON position.

7.3 Start-Up After an Extended Shutdown

When the RELIANT Oxygen Concentrator is turned on after an extended shutdown, the oxygen receiver may be full of air or low purity oxygen. Before the RELIANT can supply oxygen within purity specifications, you must purge all air from the oxygen receiver(s). To do this, follow all steps in Section 7.1.

7.4 Manual Mode

In Manual Mode, the unit will cycle continuously. This mode should only be used during initial start up.

7.5 Auto Mode

In Auto Mode, the compressor will turn off intermittently. When the pressure in the receiver(s) reaches the high pressure setpoint, the unit will stop cycling. When the pressure falls below the low pressure setpoint, the unit will begin to cycle again. This mode should be used during normal operation.
7.6 Shutdown

**WARNING**

Do not turn off power to the oxygen concentrator unless you are sure that the facility does not require any oxygen, or there is a sufficient alternative/backup source of oxygen.

1. Close the primary oxygen ball valve (see Figure 4). This ensures that the oxygen receiver(s) is/are full the next time of use, even if there is a leak beyond the location of the primary ball valve.
2. Observe that the AUTO/MANUAL switch is in the AUTO position, and wait until the amber light shuts off.
3. Set the ON/OFF switch to the OFF position.

**CAUTION**

Failure to wait until the amber light on the AUTO/MANUAL switch automatically shuts off results in initially lower purity oxygen during subsequent use.

**NOTE**

If the unit is equipped with an oxygen monitor and an auxiliary oxygen receiver is used, close the oxygen isolation ball valve on the receiver. The oxygen monitor allows a small amount of oxygen to flow through its sensor to the atmosphere. If this valve is not closed during an extended shut down, the auxiliary receiver will slowly lose its oxygen through the oxygen monitor.
8.0 Maintenance/Service

To ensure the long life of your RELIANT Oxygen Concentrator, maintain the unit as described in the following sections.

Foreign particles in the feed air affect the operation of the oxygen concentrator. The filters supplied in the concentrator are factory-selected based on the unit's air requirements and average air conditions.

![WARNING]

Electrical shock hazard. The interior of the RELIANT Oxygen Concentrator contains electrical parts that can produce an electrical hazard if not handled properly. To prevent electrical shock, use extreme care when you service the system.

![CAUTION]

AirSep selects concentrator filters based on their ability to perform in severe conditions. Use of other than Original Equipment Manufacturer filters/elements can cause damage not covered under the AirSep Product Warranty.

![CAUTION]

Failure to maintain the air intake and compressor intake filters can allow foreign particles in the air to enter the oxygen concentrator and cause damage not covered under the AirSep Product Warranty.

8.1 Weekly Maintenance

Once every seven days, remove the black air filter from the left side of the enclosure and wash it with soap and water.

8.2 Semi-Annual Maintenance

8.2.1 Cleaning the Compressor Intake Filter

Once every six months, or as often as necessary, use the following procedure to clean the compressor intake filter.
For systems that include an auxiliary oxygen receiver, close the oxygen isolation ball valve.

1. Close the primary ball valve.
   This ensures that the oxygen receiver(s) is full the next time of use, even if there is a leak beyond the location of the ball valve.

2. Observe that the AUTO/MANUAL switch is in the AUTO position, and wait until the amber light shuts off.
   This allows the auxiliary oxygen receiver (if supplied) to completely fill with oxygen for immediate use when required. It also allows the oxygen concentrator to shut down at the proper point in its cycle.

3. Set the ON/OFF switch to the OFF position.

4. Unplug the unit.

5. Remove the left side panel on the oxygen concentrator.

6. Pull up on the black cap on the compressor intake filter housing to remove it. This is attached to the gray PVC pipe located between the oxygen receiver and the front of the concentrator.

7. Remove and wash the black foam insert with soap and water.

8. Replace the black foam insert.

9. Replace the black cap.

10. Replace the left side panel on the oxygen concentrator.

For systems that include an auxiliary oxygen receiver, open the oxygen isolation ball valve.

11. Follow all steps in Section 7.1.
8.2.2 Adjusting the Oxygen Monitor Regulator

For systems that include an auxiliary oxygen receiver, close the oxygen isolation ball valve.

1. Close the primary oxygen ball valve.
2. Observe that the AUTO/MANUAL switch is in the AUTO position, and wait until the amber light shuts off.
3. Set the ON/OFF switch to the OFF position.
4. Unplug the power cord from the electrical outlet.
5. Remove the left side panel.
6. Pull outward on the oxygen monitor regulator knob, and turn it fully counterclockwise.

Remove any tie-wraps from the tubing before you disconnect it.

7. Disconnect the output tubing at the oxygen monitor board. The oxygen monitor board is located towards the top of the electrical panel.
8. Connect the output tubing to a (maximum 10 psig [70 kPa] [.7 atm] [.7 bars]) pressure gauge.
9. Adjust the knob on the oxygen monitor regulator until the gauge registers 5 psig (35 kPa) (.3 atm) (.3 bars). The regulator is attached to the oxygen receiver.
10. Lock the oxygen monitor regulator knob.
11. Remove the gauge from the oxygen monitor regulator tubing.
12. Reconnect the output tubing to the oxygen monitor board.
13. Secure the tubing with new tie-wraps.
14. Replace the left side panel.
For systems that include an auxiliary oxygen receiver, open the oxygen isolation ball valve.

15. Follow all steps in Section 7.1.

8.3 Annual Maintenance

The expected life of the coalescing filter element is approximately 12 months. Failure to replace the filter element on schedule results in a void AirSep Product Warranty.

AirSep selects concentrator filters based on their ability to perform in severe conditions. Use of other than Original Equipment Manufacturer filters/elements can cause damage not covered under the AirSep Product Warranty.

Failure to maintain the air intake and compressor intake filters can allow foreign particles in the air to enter the concentrator and cause damage not covered under the AirSep Product Warranty.

8.3.1 Coalescing Filter Element Replacement

The coalescing filter is located inside the cabinet behind the OXYGEN RECEIVER PRESSURE gauge on the control panel. It removes any foreign particles present in the oxygen supply.

Order the element to be replaced through the AirSep Industrial Service Department. Specify Part Number FI018-1, cleaned for oxygen service. Contact AirSep Monday through Friday, from 8:00 a.m. to 4:00 p.m. Eastern Standard Time/USA or Canada, at 1-800-320-0303 or (716) 691-0202 outside of the USA/Canada.
For systems with an auxiliary oxygen receiver, close the oxygen isolation ball valve.

1. Wash your hands thoroughly, and make sure they are oil-free before you begin this procedure.

Oxygen can cause spontaneous combustion, and as such, is a fire hazard. Make sure that no flammable materials are located in the oxygen concentrator area designated "Oxygen in Use — No Smoking."

2. Close the primary oxygen ball valve.
3. Observe that the AUTO/MANUAL switch is in the AUTO position, and wait until the amber light shuts off.
4. Set the ON/OFF switch to the OFF position.
5. Unplug the power cord from the electrical outlet.
6. Remove the left side panel.
7. Push up on the pin on the bottom of the filter bowl.

Pressure releases when you push up on the pin on the filter bowl.

8. When the OXYGEN RECEIVER PRESSURE gauge registers 0 psig, the unit is depressurized.
9. When the unit is depressurized, replace the filter element.

To gain access to the element, you must remove the filter bowl. Unscrew the bowl counterclockwise to remove it. Use one hand to steady the filter base while removing the bowl with the other to ensure you do not loosen the fittings and hoses connected to the sides of the filter.

Unscrew the filter element, and remove the O-rings. Replace the element and both O-rings with new ones, taking care to ensure that they remain oil- and grease-free. Reconnect the bowl to the filter body. Use one hand to steady the filter base while making sure the filter bowl is completely screwed on with the other.

For systems with an auxiliary oxygen receiver, open the oxygen isolation ball valve.

10. Leak test the coalescing filter assembly.

11. Follow all the steps in Section 7.1.
9.0 Troubleshooting

The AirSep RELIANT Oxygen Concentrator runs pressurized during normal operation. You must depressurize the unit BEFORE you attempt any REPAIRS.

Use the following procedure to depressurize the oxygen concentrator safely.

1. Shut down the oxygen concentrator as described in Section 7.6.
2. To depressurize the concentrator, follow the steps in the Coalescing Filter Element Replacement procedure in Section 8.3.1.

If the unit needs to be pressurized to troubleshoot it, close the oxygen isolation ball valve and let the unit run in the MANUAL position while the ON/OFF switch is in the ON position. Make sure you open the oxygen isolation ball valve after you complete troubleshooting.

3. The OXYGEN RECEIVER PRESSURE gauge should now register 0. If it does not, stop and contact your nearest AirSep Service Representative or the AirSep Industrial Service Department for further instructions.

Contact the AirSep Industrial Service Department by phone Monday through Friday between 8:00 a.m. and 4:00 p.m. Eastern Standard Time/USA or Canada at 1-800-320-0303 or (716) 691-0202 outside of the USA/Canada.

4. When the OXYGEN RECEIVER PRESSURE gauge registers 0, turn the oxygen concentrator ON/OFF switch to the OFF position.
5. Proceed to determine and repair the problem.
6. When you complete the repair, start up the oxygen concentrator as described in Section 7.1.
9.1 Troubleshooting Chart

The chart on the following pages is a guide for troubleshooting the AirSep RELIANT Oxygen Concentrator.

---

**WARNING**

Electrical shock hazard. The interior of the oxygen concentrator contains electrical parts that can produce an electrical hazard if not handled properly. To prevent electrical shock, use extreme care when you service the system.

---

**CAUTION**

The Printed Circuit Boards (PCBs) contain components that are sensitive to electrostatic discharge (ESD) and can be damaged if not handled properly. As when handling any ESD-sensitive PCB, observe standard ESD safety procedures. These procedures include the following:

- Handle the PCB only by the edges.
- Work on a grounded ESD mat.
- Wear a grounded wrist strap.
- Store PCBs only in anti-static bags.

</tbody>
</table>
9.1.1 Pressure Switch Troubleshooting

The pressure switch is located across from the electrical panel above the fan.

If the pressure switch does not work properly, review the following probable causes:

<table>
<thead>
<tr>
<th>Probable Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incorrect electrical connections.</td>
<td>Check leads to switch. Make sure they are properly connected.</td>
</tr>
<tr>
<td>Faulty control circuit.</td>
<td>Check electrical power supply to switch. Check for open-circuited or grounded wires and loose connections at terminal block or switch.</td>
</tr>
<tr>
<td>Incorrect adjustment.</td>
<td>Check high and low adjustments for proper setting. (See Appendix C — Component Literature.)</td>
</tr>
</tbody>
</table>

If you cannot correct the operation of the pressure switch, replace the entire switch.

9.1.2 Solenoid Valve Troubleshooting

If a solenoid valve does not energize or stays constantly energized, review the following probable causes:

<table>
<thead>
<tr>
<th>Probable Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defective valve.</td>
<td>Rebuild or replace valve.</td>
</tr>
<tr>
<td>Defective circuit board.</td>
<td>Replace circuit board.</td>
</tr>
<tr>
<td>Defective wire to valve.</td>
<td>Repair or replace wire.</td>
</tr>
<tr>
<td>Defective coil.</td>
<td>Replace coil.</td>
</tr>
</tbody>
</table>

To determine if a solenoid valve, main circuit board, or wire is defective, review the following:
Solenoid Valves
Set a voltmeter to DC, and carefully connect the leads to the two terminal spades on the coil of the solenoid valve. The voltmeter should register 100 VDC ±10% when energized, and 0 when de-energized.

Compressor Relief Valve
This valve is normally closed. A problem with the valve exists only if air constantly escapes from the outlet.

Whenever you start up the RELIANT, it is normal for air to escape from the compressor relief valve for 3-5 seconds. During this period, the valve receives 0 voltage.

If all of the solenoid valves receive the proper voltage but a solenoid valve still malfunctions, proceed to rebuild the valve. Refer to the troubleshooting chart for further information.

If any valve, with the exception of the compressor relief valve, does not energize:

1. Check the wires from the circuit board to the valves for defects.
2. If wires do not appear defective, replace the circuit board.
3. If the problem still exists, replace the solenoid valve coil.
9.1.3 Main Circuit Board Removal

1. Set the unit's ON/OFF switch to the OFF position, and unplug the power cord.
2. Remove the left side panel.
3. Disconnect the connectors from the circuit board. If the unit has an oxygen monitor installed, the main circuit board is the lower one.

The Printed Circuit Boards (PCBs) contain components that are sensitive to electrostatic discharge (ESD) and can be damaged if not handled properly. As when handling any ESD-sensitive PCB, observe standard ESD safety procedures. These procedures include the following:

- Handle the PCB only by the edges.
- Work on a grounded ESD mat.
- Wear a grounded wrist strap.
- Store PCBs only in anti-static bags.

4. Push in on the board support tabs with a slotted screwdriver while you pull each corner.
5. Remove the circuit board.

9.1.4 Main Circuit Board Installation

1. Push the circuit board on to the four support tabs.
2. Firmly plug the connectors into the new circuit board so that the connectors' locking tabs lock against the circuit board.
3. Reconnect the side panel.
9.1.5 Compressor Removal

To remove the compressor for exchange, follow the steps below:

1. Set the ON/OFF switch to the OFF position, and unplug the power cord.
2. Remove both side panels.
3. Remove the suction tube and the red air hose from the compressor.

   ![NOTE]

   To remove the air hose from the compressor, make sure that the hose does not turn when you loosen the brass nut.

4. Disconnect the two power cords from the terminal block and the two capacitor wires.
5. Remove the four bolts that connect the compressor plate to the base of the unit.
6. Slide out the compressor.

   ![NOTE]

   Take note of the assembly of the spring mounts. These components will need to be reinstalled when the new compressor is assembled.

7. Carefully place the compressor upside down, and remove the four bolts that connect the compressor to the mounting plate.
9.1.6 Compressor Installation

To install a new compressor, follow the steps below:

1. Place the new compressor upside down.

2. Align the holes of the aluminum spring mount plates with the holes on the compressor.

3. Place the springs on the spring mount plates.

4. Place the compressor mounting bracket onto the springs.

5. Thread the four bolts into the compressor ensuring that all spring mount assembly parts are present.

6. Turn the compressor right side up. Make sure that the springs are centered on the black plastic bushings.

7. Thread the brass fittings and pressure relief valve into the compressor.

8. Follow the compressor removal procedure in reverse order.

**NOTE**

Use an oxygen compatible leak-detecting solution to leak test the brass fittings and the air hose to ensure that no air leaks from these connections.

9. Reconnect both side panels on the unit.

* SCFH (standard cubic foot) gas measured at 1 atmosphere and 70°F.  
** Nm³ (normal cubic meters) gas measured at 1 atmosphere and 0°C.  
*** slpm (liter per minute) gas measured at 1 atmosphere and 70°F.
Provide proper voltage to the oxygen generator (120 VAC ±10% or 220 VAC ±10%) to prevent damage not covered under the AirSep Product Warranty.

The RELIANT Oxygen Concentrator delivers up to 17 SCFH (.45 Nm³/hr or 8 slpm) of 90% ±3% oxygen gas and operates at delivery pressures up to 50 psig (345 kPa) (3.4 atm) (3.4 bars) at 120 VAC, 60 Hz or 220 VAC, 50 Hz.

Operation at a flow rate or delivery pressure outside standard specifications requires concentrator modification(s). Please contact AirSep for further assistance.

MODELS 2C915A, 4C442

MODELS 2C069B, 4C015B

Figure 1

Description

The Dayton shaded pole blower, finished in grey enamel, is a single speed unit designed specifically for heating, cooling, exhausting, ventilating and drying. It is field interchangeable with most direct drive blowers and can be mounted in any discharge position. Blower is driven by a shaded-pole motor which features automatic-reset thermal protection.

Unit automatically shuts off should excessive motor temperatures develop. Maximum ambient temperature is 104°F (40°C).

General Safety Information

1. Follow all local electrical and safety codes, as well as the National Electrical Code (NEC) and the Occupational Safety and Health Act (OSHA).
2. Blower must be securely and adequately grounded. This can be accomplished by wiring with a grounded, metal-clad raceway system, by using a separate ground wire connected to the bare metal of the blower frame, or other suitable means.
3. Always disconnect power source before working on or near a motor or its connected load. If the power disconnect point is out-of-sight, lock it in the open position and tag to prevent unexpected application of power.
4. All moving parts should be guarded.
5. Be careful when touching the exterior of an operating motor — it may be hot enough to be painful or cause injury. With modern motors this condition is normal if operated at rated load and voltage — modern motors are built to operate at higher temperatures.
6. Protect the power cable from coming in contact with sharp objects.
7. Do not kink power cable and never allow the cables to come in contact with oil, grease, hot surfaces, or chemicals.
8. Make certain that the power source conforms to the requirements of your equipment.
9. Wiping or cleaning rags and other flammable waste materials must be placed in a tightly closed metal container and disposed of later in the proper fashion.
10. When cleaning electrical or electronic equipment, always use an approved cleaning agent such as dry cleaning solvent.
11. Do not use these blowers in explosive atmospheres.

(*) At Free Air.

NOTE: Automatic-reset thermal protection. All data based on 60Hz operation. When operated on 50Hz, a decrease of approximately 20% will occur in flow rate performance.
SERVICE MANUAL

MICROalescer Filter
Models M00-C2-000 and M00-02-000
with Variations and Accessories

9SM-NH-M00
NOVEMBER 1988

REPLACES SERVICE MANUAL PAGES: SM-M00-95M,
9SM-BJ-M00, CJ-M00-95M,
FD-M00-95M, KB-M00-95M
and ME-M00-95M.

WARNING
DO NOT PLACE PLASTIC BOWL UNIT IN SERVICE WITHOUT METAL BOWL GUARD INSTALLED.

Plastic bowl units are sold only with metal bowl guards except miniature models.
To minimize the danger of flying fragments in the event of plastic bowl failure, the
metal bowl guards should not be removed. If the unit is in service without the
metal bowl guard installed, manufacturer's warranties are void, and the manu-
ufacturer assumes no responsibility for any resulting loss.

IF UNIT HAS BEEN IN SERVICE AND DOES NOT HAVE A METAL BOWL GUARD,
ORDER ONE AND INSTALL BEFORE PLACING BACK IN SERVICE.

CAUTION
Certain compressor oils, chemicals, household cleaners, solvents, paints and
fumes will attack plastic bowls and can cause bowl failure. Do not use these
materials. When bowl becomes dirty replace bowl or wipe only with a clean,
dry cloth. Never metal bowl guard or buy and install a metal bowl guard
with a plastic bowl. No plastic bowl with a metal bowl or a new plastic bowl and a metal bowl guard.

SOME OF THE MATERIALS THAT WILL ATTACK POLYCARBONATE PLASTIC BOWLS

Alcohol "Perox-Guard" National Compound #111
Butyl rubber "Playing Card" #1
Cyclohexane 4.21 and 9.23
Ethylene oxide 0.5
Hexane 26
Isopropyl alcohol 0.8
Methanol 0.5
Methyl ethyl ketone 0.5
Methyl acetate 0.5
Propylene glycol acetate 0.5
Sodium hydroxide
Sodium cyanide

dane

TRADE NAMES OF SOME COMPRESSION OILS, NUMBER COMPOUNDS AND OTHER MATERIALS THAT WILL ATTACK POLYCARBONATE PLASTIC BOWLS

Alcoa "Perox-Guard" National Compound #111
Butyl rubber "Playing Card" #1
Cyclohexane 4.21 and 9.23
Ethylene oxide 0.5
Hexane 26
Isopropyl alcohol 0.5
Methanol 0.5
Methyl ethyl ketone 0.5
Methyl acetate 0.5
Propylene glycol acetate 0.5
Sodium hydroxide
Sodium cyanide

CAUTION
Except as otherwise specified by the manufacturer, the product is specifically
designed for compressed air service, and use with any other fluid bleed or gas
is a misapplication. For example, use with or injection of certain hazardous liquids or
gases in the system (such as alcohol or liquid petroleum gas) could be harmful to
the unit or result in a combustible condition or hazardous external message.
Manufacturer's warranties are void in the event of misapplication, and manufacturer
assumes no responsibility once the unit is in service. The user is responsible for
providing the necessary training to their employees in the use of this product in
air, or for misapplication, applications, or for the support systems sold
manufacturer for written approval.

RELIENT Instruction Manual
Microalescer Filter

NRR = NOT NORMALLY REPLACED

(see reverse side for Installation and Maintenance Instructions)
INSTALLATION

1. Refer to warning on front page.
2. Purge downstream air line of oil.
3. Install as close as possible to point where air is being used.
4. Install the unit with the air flowing in the direction indicated by arrow on the body.
5. Maximum inlet pressure and operating temperature ratings are: transparent plastic bowls, 150 psig (10.3 bar) and 125°F (51.7°C); metal bowls, 200 psig (13.8 bar) and 175°F (79°C).

TYPICAL INSTALLATION (not to scale)

A. PREFILTER - It is recommended that a Wilkerson 5-micron-rated prefilter, be installed upstream from the coalescer filter to prolong element life.
B. AIR DRYER - (refrigerative or Twin Tower) An air dryer is generally preferred for optimum results, but is optional.
C. AC PACK - The Type D element is an adsorption type for removing oil vapors, oil-associated odors, whether petroleum-base or synthetic base. Element service life is approximately 1000 hours.
D. DIFFERENTIAL PRESSURE GAUGE - Maximum recommended pressure drop across coalescer filters is 10 psi (0.7 bar). This can be monitored by installing a Wilkerson differential pressure gauge.
E. VALVE - Do not use a valve or shutoff device in conjunction with a coalescer filter that will allow a momentary or surge pressure drop greater than 50 psi (3.4 bar). To avoid high surges which can either ruin the element or momentarily allow downstream contamination, use a slow-opening type valve.

MAINTENANCE

1. The element operates effectively when it is saturated. The element's useful life will end only when the resistance to flow becomes too high and the maximum permissible pressure is reached. The element cannot be cleaned or reused and must be replaced at the end of its useful life.
2. Drain the unit at least once per shift.
3. When bowl becomes dirty replace the bowl or clean by wiping with a dry, clean cloth.
4. Before placing the unit in service, make sure that the bowl and bowl guard are reinstalled, and securely locked in place.

Pressure Gauges

Application
Fluid medium which does not clog connection
port or corrode copper alloy. Example: hydraulic
and pneumatic systems, pumps, compressors,
water systems, regulators.

Sizes
1 1/2", 2" and 2 1/2" (40 mm, 50 mm and 63 mm)

Accuracy
1 1/2" ± 2/3/3% (ASME B40.1 Grade B)
2" and 2 1/2" ± 1.5% full scale value

Ranges (All ranges not stocked)
Vacuum 30° Hg
Compound to 200 PSI
Pressure from 10 PSI to 5000 PSI

Working Range
Steady: 3/4 of full scale value
Fluctuating: 2/3 of full scale value
Short Time: Full scale value

Operating Temperature
Ambient: -13°F to 140°F (-25°C to 60°C)
Media: max. 140°F (+60°C)

Temperature Error
Additional error when temperature changes
from reference temperature of 68°F (20°C)
+0.3% for every 18°F (10°C) rising or falling.
Percentage based on gauge accuracy.

STANDARD FEATURES

Connection
Material: copper alloy
Lower mount (LM)
Center back mount (CBM)

Bourdon Tube
Material: copper alloy
30° Hg (Vac) to 600 PSI C-type
800 PSI to 5000 PSI helical type

Movement
Copper alloy

Dial
White plastic with stop pin and
black and red lettering

Pointer
1 1/2" Black plastic
2" and 2 1/2" Black aluminum

Case
1 1/2" Black plastic
2" and 2 1/2" Black steel
U-clamp case; Black steel with chrome
plated crimped ring

Standard Scales
PSI only 1 1/2" and 2" 1/8" NPT CBM
PSI/KPA for 2" 1/4" NPT and 2 1/2"

ORDER OPTIONS (min. order may apply)
Front or rear flange
Brass threaded or pressfit restrictor
U-Clamp
Plastic adapter ring for non-metric panel cutout
Sip-fit or friction ring
Glass window
Stainless steel case
Brass case
Special case colors
Special connections limited to wrench flat area
Nickel or chrome plated connection
Oxygen cleaned
Medical specification
Rubber cover
Custom dial lay-out
Other pressure scales available:
Bar, KPA, Kg/cm² and dual scales
DIN standards
Red set pointer
Red drag pointer

INSTALLATION AND MAINTENANCE INSTRUCTIONS

ADJUSTABLE DEADBAND COMPACT LINE SWITCHES

OPEN FRAME, GENERAL PURPOSE OR WATERFRONT SWITCH ENCLOSURES

DESCRIPTION

The Adjustable Deadband Compact Line Switch is of rugged aluminum alloy construction. The switch may be provided with a General Purpose NEMA Type 1 Switch Enclosure, a Watertight NEMA Type 4 and 6 Switch Enclosure or an open frame switch. The compact line switch may be supplied as a complete unit, that is, the assembly switch unit and the transducer (either pressure, temperature or mechanical transducer) completely assembled and or separate units to be assembled on site. The assembly (set point) and the maximum (test point) are each independently adjustable over the full range of the switch. The switch assembly can be used with a wide selection of interchangeable pressure, temperature and mechanical transducers to cover a broad range of pressures, fluids, temperatures and mechanical movements. The switch will control electrical circuits in response to changes in pressure, temperature or mechanical signals.

IMPORTANT: This sheet is designed to cover the installation and use of this switch on pressure, temperature, and mechanical transducers and mechanical transducers. Review this sheet and select the paragraphs that apply to your particular installation and application. Throughout the sheet, the word "signal" will be used to mean pressure, temperature or mechanical changes.

INSTALLATION

Check the nameplate for the correct catalog number, pressure range, temperature range, media and rated over range pressure or temperature. Nameplate are located on cover and on the bottom of the transducer. Check to see that the correct unit in each number is the same. (For more details, refer to page 2)

IMPORTANT: All internal adjustments have been made at the factory. Any adjustment, alteration or repair to the normal parts of the switch other than stated herein voids all warranties. Signal setting adjustments required are made by the two adjusting nuts on the top of the switch.

TEMPERATURE LIMITATIONS

Ambient temperature limits are -4°F to 122°F (25°C). To determine full temperature limitations, see Form No. P7053 for Pressure Transducer catalog numbers and construction materials, then refer to chart below.

<table>
<thead>
<tr>
<th>Transducer Construction Materials</th>
<th>Ratings Fluid Temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brass N or Stainless Steel</td>
<td>-4°F to 200°F (121°C)</td>
</tr>
<tr>
<td>Copper</td>
<td>-4°F to 200°F (121°C)</td>
</tr>
<tr>
<td>316 Stainless Steel</td>
<td>-4°F to 400°F (204°C)</td>
</tr>
<tr>
<td>All Monel</td>
<td>Maximum 100°F (37°C)</td>
</tr>
<tr>
<td>All Monel For Water Service</td>
<td>Maximum 130°F (55°C)</td>
</tr>
</tbody>
</table>

For steam service, the fluid temperature with a signal (nipple side or condenser loop) installed directly into the transducer will be below 176°F (80°C).

ASSEMBLY OF SWITCH AND TRANSDUCER UNITS

(Refer to Figure 2)

IMPORTANT: The switch unit and transducer unit may be provided as a complete assembly or as separate units. If separate units are provided, refer to Form No. P7053 for complete listing of switch unit and transducer unit combinations. Form No. P7053 is provided to ensure that the proper unit will be used to assemble the proper transducer unit. Pay careful attention to exploded view provided in Figure 2 for assembly of switch unit and transducer units. Proceed in the following manner:

1. CAUTION: The third digit in the catalog number on both the switch unit and the transducer unit must be identical. If not, do not assemble the entire. If the same, proceed.
2. Remove bolts (from base of switch unit). On general purpose or watertight constructions, remove switch cover.
3. Remove instruction label and pressure or mechanical switch range scale from the transducer unit.
4. Place transducer unit on base of switch unit and assemble. Place bolts (4) approx. two turns by hand to avoid the possibility of cross threading. After initial engagement, torque bolts (4) to a crossing manner to 80 ± 10 inch-pounds.
5. Remove backing paper from range scale and install up the front of the switch body over thealf opening and between the two sides with the adjusting indicator points.

MOUNTING

The switch may be mounted in any position.

Piping/Tubing (Pressure Transducer)

Adequate support must be provided for proper mounting of switch. Be sure to provide for free movement of the switch. This will help to keep the switch from being subjected to vibration or shock. To minimize the effects of vibration a switch, mount switch unit and transducer unit in a vertical position. It is recommended that flexible lines be used whenever possible. Apply pipe compound to any threads of any fittings and bolts. If the piping system is long or complicated, it is necessary to use the transducer and control movement. Pipe strain on switch should be avoided by proper support and rigidity of piping. When light gauges piping, do not use switch as a lever. Wrenches applied to transducer body or piping are to be located as close as possible to connection point. IMPORTANT: For steam service, install a condensate loop (piping or steam bypass tube) directly into the pressure transducer.

CAUTION: To avoid damage to the transducer body, DO NOT OVERTIGHTEN PIPING CONNECTIONS. If Teflon® tape, pipe or similar lubricant is used, use extra care due to reduced friction.

IMPORTANT: To eliminate the effect of undesirable pressure fluctuations in the system, install a surge regulator.

WIRING

Wiring must comply with local codes and the National Electrical Code. The general purpose switch enclosure is provided with a 3/8" diameter hole to accommodate 3/16" electrical cable or connector. It is recommended that a flexible conduit be used. If rigid conduit is used, do not consider it as a means of supporting (mounting). For watertight switch enclosures, a conduit gland must be used at the opening. See Note at 5-amp dump. For conduit both use conduits both Part No. P7001 or equivalent. IMPORTANT: Electrical cord must be within range stated on nameplate. Failure to use within the electrical range of the switch may cause damage to or premature failure of the electrical switch. Use No. 14 AWG copper wire rated for 60°C minimum. CAUTION: Do not use excessive connectors force on any switch when making terminal connections. When connections are made, be sure there is no stress on the wire leads. Either condition may cause malfunction of switch.

Electrical Ratings For General Purpose Switches:

<table>
<thead>
<tr>
<th>Currents (amp.)</th>
<th>Ratings for Limit Controls and Pressure Operated Switches:</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Amps, 125 VAC</td>
<td>1/8 HP or 60 Watts, 125 VAC (125°C)</td>
</tr>
<tr>
<td>1/4 HP or 180 Watts, 250 VAC (125°C)</td>
<td>1/2 Amp, 125 VDC</td>
</tr>
<tr>
<td>1/4 Amp, 250 VDC</td>
<td>1 Amp, 125 VAC</td>
</tr>
</tbody>
</table>

For steam service, the fluid temperature with a signal (nipple side or condenser loop) installed directly into the transducer will be below 176°F (80°C).

(SEE NOTE)

NOTE: Terminals (C, NC & NO) on switch are located differently than shown in the schematic above. Common "C" is located at the bottom. Normally Closed "NC" is located at the top.

INSTALLATION OF TEMPERATURE TRANSDUCERS

(Refer to Figure 5)

DIRECT PROBE

The Direct Probe (Local) Temperature Transducer is provided with a 1/2" N.P.T. connection. When installing, do not use switch unit at a lever for tightening. Use wrenching flanges provided at base of transducer for tightening.

CAPILLARY AND BULB

The Capillary and Bulb (Remote) Temperature Transducers are provided with a length of capillary and a 3/8" diameter setting bulb. CAUTION: Do not bend capillary at sharp angles. For proper operation, the capillary tubing is completely immersed in fluid and not in contact with heating elements or anything that would directly affect the temperature of the fluid being sensed.

**DESCRIPTION**

This sheet is a listing of switch unit and transducer unit combinations. The chart below is provided to insure that the proper switch unit is assembled to the proper transducer unit, thus providing a complete adjustable deadband pressure switch.

In the chart below, locate the switch unit catalog number being used. Then going to the right on the same line (as the switch unit catalog number) find the transducer unit catalog number which may be used with this particular switch unit. **IMPORTANT:** The third digit in both the switch unit and transducer unit catalog numbers must be identical. For example, a Switch Unit Catalog No. PA20A can be used with Transducer Unit Catalog No. RE20A11. The mating produces a complete adjustable deadband pressure switch, Catalog No. PA20A/RE20A11. Note third digits in both catalog numbers are identical. If the third digit is not identical, it is an incorrect mate and the units should not be assembled.

**NOTE:** Switch units listed to left may be used with any transducer units listed to right provided they are on the same horizontal line.

**IMPORTANT:** All units listed above are suitable for air and hydraulic oil service. For water service, all units are suitable except aluminum.

**NOTES:**

1. Rated overrange pressure on RF10A71 is 150 psig and on RG10A71 is 300 psig.
2. These transducers are acceptable for steam service if used with pigtail (condensate loop) between steam line and transducer.
3. Transducers ending in 42 have 316 S.S. bodies, not 303 S.S.
UL LISTINGS

This sheet is a listing of switch unit and transducer unit combinations that are Listed and/or Component Recognized by Underwriters Laboratories, Inc. The table below is provided to ensure that the proper switch unit (section) is assembled to the proper transducer unit (section), thus providing a complete, UL Listed and/or Recognized Component pressure switch. Only completely assembled combinations are UL Listed and/or Recognized Component. See table below for UL complementary product category listing and guide card numbers.

INSTALLATION INSTRUCTIONS
To determine the proper switch and transducer combinations, first locate the switch unit catalog number in the table below. Then going to the right on the same line (as the switch unit catalog number) find the transducer unit catalog number which may be used with this particular switch unit. IMPORTANT: The third digit in both the switch unit and transducer unit catalog numbers must be identical. For example, a switch unit catalog No.PA31A can be used with transducer unit catalog No.RV34A11. The mating produces a complete pressure switch Catalog No.PA31A/RV34A11.

NOTES:

- All transducers used with general purpose and water tight switch units are UL Listed as Industrial Control Equipment—Enclosed, Motor Controllers —Pressure Operated, Guide NKP22. Transducers which end in 11, 21, 32, or 42 and used with General Purpose and Water Tight Switch Units are also UL Listed as Switches for Heating and Cooling Appliances, Guide MPHX.
- All transducers used with open-frame (no enclosure) switch units are considered UL Recognized Components as Industrial Control Equipment, Motor Controllers — Pressure Operated, Guide NKP22. Transducers which end in 11, 21, 32, or 42 and used with open-frame (no enclosure) switch units are also considered UL Recognized Components as Switches for Heating and Cooling Appliances, Guide MPHX.

### NOTES:

1. All transducers used with general purpose and water tight switch units are UL Listed as Temperature — Indicating and Regulating Equipment Guide XAFP.
2. All transducers used with open frame (no enclosure) switch units are considered UL Recognized Components as Temperature — Indicating and Regulating Equipment Guide XAFP2.
3. Optional features, armored capillary, and capillary length identified by the seventh, eighth, and ninth digit codes respectively of the transducer catalog number are also UL Listed.
DESCRIPTION

This sheet is a listing of switch unit and transducer unit combinations. The chart below is provided to insure that the proper switch unit is assembled to the proper transducer unit, thus providing a complete adjustable deadband temperature switch.

In the chart below, locate the switch unit catalog number being used. Then go to the right on the same line (as the switch unit catalog number) and find the transducer unit catalog number which may be used with this particular switch unit. **IMPORTANT:** The third digit in both the switch unit and transducer unit catalog numbers must be identical. For example, a Switch Unit Catalog No. PA10A can be used with Transducer Unit Catalog No. KA10A1. The mating produces a complete adjustable deadband temperature switch. Catalog No. PA10A/KA10A1. Note third digits in both catalog numbers are identical. If the third digit is not identical, it is an incorrect mate and the units should not be assembled.

**NOTE:** Switch units listed to left may be used with any transducer units listed to right provided they are on the same horizontal line.

NELES-JAMESBURY

SPECIFICATIONS

1/4" - 2" SCREWED END - NPT and 1/2" - 2" SOLDER END
SERIES 300 BALL VALVES

FEATURES

- Series 300 valves provide quality and performance at lowest cost.
- Hot forged brass body and cap for strength, durability and compact design.
- Internal entry stem provides positive stem retention.
- Field-proven polymeric sealing for reliable shutoff and long cycle life.
- Large port sizes for maximum flow capacity.
- Series 371 vent valves provide automatic downstream venting when in the closed position.
- Full compliment of optional accessories include: 4" stem extension, round handle, stainless steel handle, locking device and memory (balancing) stop kits for use with lever handle to permit periodic opening to a specific partially open position.

Series 300 ball valves are the ideal answer for reliable operation when cost is the primary consideration. Equally important, these valves meet Neles-Jamesbury’s quality standards. For this reason, Neles-Jamesbury ball valves are the most preferred throughout industry.

One style, the Series 371 screwed end all brass valve with TFE seats and seals, includes a venting feature which relieves pressure in lines and power devices downstream of the valve when the valve is closed. This feature is ideal for machinery that uses compressed air as its power source. When equipped with optional locking device, this valve complies with OSHA regulation 1910.147 lockout requirements. Available in 1/4" - 2" (6mm - 50mm) sizes, Series 371 vent valves are pressure rated to 200 psi (14 bar) and temperature rated from 400°F (204°C) to -20°F (-29°C).

Two other styles of these screwed and solder end valves are available: all brass, and brass with 316 stainless steel trim, both having TFE seats and seals.

For general service, Series 351 and 356 screwed end valves, available in 1/4" - 2" (6mm - 50mm) sizes, are rated to 400 psi (28 bar). In steam service, they are rated to 150 psi (10 bar). Their high temperature limit is 400°F (204°C) with a low limit of -20°F (-29°C).

Series 351 and 356 screwed end valves are listed by Underwriter Laboratories (UL) for natural and manufactured gas, other compressed gases, fuels and solvents, and fire protection trim and drain. They are also Factory Mutual (FM) approved for components in fire protection alarm, dry pipe, and sprinkler systems.

Series 341 and 346 solder end valves, available in 1/2" - 2" (13mm - 50mm), are limited by their solder joint ratings. Consult the solder joint table on page 2 for appropriate pressure and temperature ratings.

VALVE SEAT RATING
This rating is based on differential pressure with valve ball in fully closed position and refers to seats only.
Solder joint ratings per ANSI B16.18 and B16.22 are significantly lower than TFE seat rating. These joint ratings vary with solder type, tube size, and temperature.
**VALVE BODY RATING**
This is the maximum working pressure rating of the valve body only. The seat rating on page 1 (and solder connection table at right) determine the practical pressure limitation in actual service. Working pressure rating is at -20°F to +100°F (-29°C to 38°C). Test pressure is for hydrostatic test with ball half open.

SAFETY VALVES
BUILT TO ASME CODE REQUIREMENTS

Precision engineered and tested to produce the

- BEST QUALITY PRODUCT at the
- LOWEST POSSIBLE COST

Control Devices Super-Tite line of safety valves are built to ASME standards and are certified by the National Board. Each valve is built to exacting quality requirements and is set to customer specification. Widely used on air compressor receivers and related pneumatic equipment.

CAUTION: These valves were designed to protect pressure vessels built to ASME code standards. Misapplication or misuse can result in serious injury or death. For specific application and installation details, please consult Control Devices or refer to section UG-125 through UG-136 and Appendix M of Section VIII of the ASME Boiler and Pressure Vessel Code.

DESCRIPTION
Bulletin 8225 valves are 2-way normally closed, direct-acting solenoid valves made of rugged brass or stainless steel. Valves are sub-miniature in size and are provided with an open-frame solenoid.

OPTIONAL FEATURES
Mounting Bracket KIT No. 224-736: This kit provides mounting of valves for ease of installation, removal and adjustment to piping (See Figure 2).
Plug Connector Kit No. 226-061: The open-frame solenoid with spade terminal connections may be used with the plug connector kit providing a 2-pole with grounding contact DIN Type 43650 construction (See Figure 4.).
Conduit Connector Kit No. 224-715: The open-frame solenoid with lead wires may be converted to gasketed threaded conduit hub enclosure for watertight or general purpose construction (See Figure 5.).

OPERATION
Normally Closed: Valve is closed when solenoid is de-energized. Valve is open when solenoid is energized.
IMPORTANT: No minimum operating pressure required.

INSTALLATION
Check nameplate for correct catalog number, pressure, voltage and service.

POSITIONING
This valve is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the plug/socket sub-assembly area.

MOUNTING
For valve body mounting dimensions refer to Figure 1. For dimensions of mounting bracket supplied in Mounting Bracket Kit No. 224-736, refer to Figure 2.

PIPING
Connect piping to valve according to markings on valve body. Inlet port is marked “IN” and outlet port is marked “OUT”. Apply pipe compound sparingly to male pipe threads only. If applied to valve threads the compound may enter the valve and cause operational difficulty. Avoid pipe strain by properly supporting and aligning piping. When tightening the pipe, do not use valve or solenoid as a lever. Locate wrenches applied to valve body or piping as close as possible to connection point.
IMPORTANT: To protect the solenoid valve, install a strainer or filter, suitable for the service involved, in the inlet side as close to the valve as possible. Clean periodically depending on service conditions. See ASCO Bulletins 8600, 8601 and 8602 for strainers.

WIRING
Wiring must comply with local codes and the National Electrical Code. Open-frame solenoid may be rotated in 90° increments by lifting the coil upward and rotating it in either direction.
NOTE: To convert from Alternating Current (A-C) to Direct Current (D-C) or vice versa, it is necessary to change only the coil. However, the valve pressure rating will change. Consult ASCO Catalog.

SOLENOID TEMPERATURE
Coils for Bulletin 8225 valves are designed for continuous duty. When solenoid is energized for a long period, the solenoid enclosure becomes hot and can be touched by hand only for an instant. This is a safe operating temperature. Any excessive heating will be indicated by the smoke and odor of burning coil insulation.

MAINTENANCE
NOTE: It is not necessary to remove the valve from the pipeline for inspecting, cleaning or coil replacement.
WARNING: Turn off electrical power supply and depressurize valve before inspecting, cleaning or replacing the coil.

CLEANING
All solenoid valves should be cleaned periodically. The time between cleanings will vary depending on the medium and service conditions. In general, if the voltage to the coil is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. Clean valve strainer or filter when cleaning the valve.

PREVENTIVE MAINTENANCE
1. Keep the medium flowing through the valve as free from dirt and foreign material as possible.
2. While in service, the valve should be operated at least once a month to insure proper opening and closing.

CAUSES OF IMPROPER OPERATION
1. Faulty Control Circuit: Check the electrical system by energizing the coil. A metallic “click” signifies that the solenoid is operating. Absence of the “click” indicates loss of power supply. Check for loose or blown fuses, open-circuited or grounded coil, broken lead wires or splice connections.
2. Burned-Out Coil: Check for open-circuited coil. Replace coil if necessary. Check supply voltage; it must be the same as specified on nameplate.
3. Low Voltage: Check voltage across the coil leads. Voltage must be at least 85% of nameplate rating.
4. Incorrect Pressure: Check valve pressure. Pressure to valve must be within range specified on nameplate.
5. Excessive Leakage: Disassemble valve (see MAINTENANCE) and clean all parts. If parts are worn or damaged, replace valve. See Ordering Information.

COIL REPLACEMENT (Refer to Figure 3.)
WARNING: Turn off electrical power supply. Then proceed as follows:
1. Disconnect coil lead wires.
2. Remove retaining spring by dislodging the top spring coil and prying the spring upward.
3. Slip coil off plug/socket core tube sub-assembly.
4. Install new coil and replace retaining spring.
5. Make electrical hookup and restore electrical power.
**Valve Disassembly for Inspecting and Cleaning**

Refer to Figure 3.

**Warning:** Turn off electrical power supply and depressurize valve before inspecting and cleaning. Then proceed as follows:

1. Disassemble valve in an orderly fashion. Use exploded view for identification and placement of parts.
2. Disconnect coil lead wires.
3. Remove retaining spring by dislodging the top spring coil and prying the spring upward.
4. Slip coil off plugnut/core tube sub-assembly.
5. Remove mounting screws, cover, plugnut/core tube sub-assembly, gasket and core assembly with core spring.
6. All parts are now accessible for cleaning.

**Valve Reassembly**

1. Reassemble in reverse order of disassembly. Use exploded view for identification and placement of parts.
2. Lubricate gasket with DOW CORNING® 111 Compound lubricant or an equivalent high-grade silicone grease.
3. Replace core assembly, core spring, gasket, plugnut/core tube sub-assembly, cover and mounting screws. Torque mounting screws in a crisscross manner to $9 \pm 2$ inch-pounds ($1.8 \pm 0.2$ newton-meters).
4. Replace coil and retaining spring. Make electrical hookup and restore electrical power and line pressure.
5. After maintenance is completed, operate the valve a few times to be sure of proper operation.

COVER
GASKET
PLUGNUT/CORE TUBE SUB-ASSEMBLY
CORE ASSEMBLY
CORE SPRING (SEE NOTE 2.)
VALVE BODY

NOTES:
1. TO REMOVE RETAINING SPRING, DISLODGE TOP SPRING COIL AND PRY THE SPRING UPWARD.
2. IF CORE SPRING HAS BEEN REMOVED FROM CORE ASSEMBLY, BE SURE TO INSTALL SMALL DIAMETER END OF CORE SPRING ON CORE ASSEMBLY FIRST. THE CORE SPRING SHOULD SNAP IN PLACE AND REMAIN ENGAGED.

Figure 3. Exploded View of Bulletin 8225

Form No. VB332
INSTALLATION OF PLUG CONNECTOR KIT NO. 226-061
(Refer to Figure 4.)

1. Remove center screw from plug connector. Using a small screw driver, pry terminal block from connector housing.
2. Use stranded copper wire rated at 90°C or greater for connections. Maximum wire size is Number 18 AWG. Strip wire leads back approximately 1/4-inch for installation in socket terminals. The use of wire-end sleeves is also recommended for these socket terminals. Maximum length of wire-end sleeves to be approximately 1/4-inch. Tinning of the ends of the lead wires is not recommended.
3. Thread wire through gland nut, gland gasket, washer and connector housing. NOTE: Connector housing may be rotated 180° from position shown in Figure 4 for alternate positioning of cable entry.
4. Make electrical hookup to terminal block. Snap terminal block into connector housing and replace center screw.
5. Position gasket on coil and install plug connector. Torque center screw to 5 ± 1 inch-pounds [0.6 ± 0.1 newton-meters].

INSTALLATION OF CONDUIT CONNECTOR KIT NO. 224-735
(Refer to Figure 5.)

1. Thread coil lead wires through connector gasket and conduit connector.
2. Position gasket and conduit connector against coil and install center screw. Torque center screw to 5 ± 1 inch-pounds [0.6 ± 0.1 newton-meters].

**Installation & Maintenance Instructions**

2-WAY DIRECT-ACTING SOLENOID VALVES

NORMALLY OPEN OR NORMALLY CLOSED OPERATION

BRASS OR STAINLESS STEEL CONSTRUCTION - 1/8", 1/4", OR 3/8" NPT

---

**Series 8262 and 8263 Valves**

See separate solenoid installation and maintenance instructions for information on: Wiring, Solenoid Temperature, Causes of Improper Operation, and Coil or Solenoid Replacement.

---

**Description**

Series 8262 and 8263 valves are 2-way direct-acting general service solenoid valves. Valve bodies are of rugged brass or stainless steel. Series 8262 or 8263 valves may be provided with a general purpose or explosionproof solenoid enclosure.

Series 8262 and 8263 valves with suffix “F” in the catalog number are designed for dry inert gas and non-lubricated air service.

---

**Operation**

**Normally Open:** Valve is open when solenoid is de-energized; closed when energized.

**Normally Closed:** Valve is closed when solenoid is de-energized; open when energized.

**IMPORTANT:** No Minimum operating pressure required.

**Manual Operator (Optional)**

Manual operator allows manual operation when desired or during an electrical power outage. Two types of manual operators are available - push type (SUFFIX MO) and screw type (SUFFIX MS). To operate valve manually with push type operator, push stem at base of valve body as far upward as possible. Valve will then be in the same position as when the solenoid is energized. Removing pressure from stem will release manual operator to original position. To operate valve with a screw type manual operator, rotate manual operator stem at base of valve body clockwise until it hits a stop. Valve will now be in the same position as when the solenoid is energized. Rotate manual operator stem fully counterclockwise before operating valve electrically.

---

**Flow Metering Devices**

Valves with suffix “M” in catalog number are provided with a metering device for flow control. Turn stem to right to reduce flow, left to increase flow.

---

**Installation**

Check nameplate for correct catalog number, pressure, voltage, frequency, and service. Never apply incompatible fluids or exceed pressure rating of the valve. Installation and valve maintenance to be performed by qualified personnel.

*Note: Inlet port will either be marked “T” or “IN”. Outlet port will be marked “2”.

**Future Service Considerations**

Provision should be made for performing seat leakage, external leakage, and operational tests on the valve with a nontoxic, noncombustible fluid after disassembly and reassembly.

---

**Temperature Limitations**

For maximum valve ambient and fluid temperatures, refer to chart below. Check catalog number, coil prefix, suffix, and watt rating on nameplate to determine the maximum temperatures.

<table>

Catalog Nos. 82621200 and 8262 C200 AC construction only and Catalog Nos. 8262B214 and 8262 D200 AC and DC construction are limited to 140°F fluid temperature.

Valves with Suffix V or W that are designed for AC service and normally closed operation are for use with No. 2 and 4 fuel oil service. These valves have the same maximum temperatures per the above table except Suffix W valves are limited to a maximum fluid temperature of 140°F.

Listed below are valves with Suffix V in the catalog number that are acceptable for higher temperatures.

</tbody>
</table>

*The only exception is the 8262G and 8263G series (Class F coil) at 50 Hertz rated 11.1 and 17.1 watts are limited to 210°F fluid temperature.

**Positioning**

This valve is designed to perform properly when mounted in any position. However, for optimum life and performance, the solenoid should be mounted vertically and upright to reduce the possibility of foreign matter accumulating in the solenoid base sub-assembly area. Valves with suffix “F” in the catalog number must be mounted with the solenoid vertical and upright.
Mounting
Refer to Figure 2 for mounting dimensions.

Piping
Connect piping or tubing to valve according to markings on valve body. Inlet port will either be marked “I” or “IN.” Outlet port will be marked “2.” Wipe the pipe threads clean of cutting oils. Apply pipe compound sparingly to male pipe threads only. If applied to valve threads, the compound may enter the valve and cause operational difficulty. Avoid pipe strain by properly supporting and aligning piping. When tightening the pipe, do not use valve or solenoid as a lever. Locate wrenches applied to valve body or piping as close as possible to connection point.

IMPORTANT: To protect the solenoid valve, install a strainer or filter suitable for the service involved, in the inlet side as close to the valve as possible. Clean periodically depending on service conditions. See ASCO Series 8600, 8601 and 8602 for strainers.

MAINTENANCE

WARNING: To prevent the possibility of personal injury or property damage, turn off electrical power, depressurize valve, and vent fluid to a safe area before servicing the valve.

NOTE: It is not necessary to remove the valve from the pipeline for repairs.

Cleaning
All solenoid valves should be cleaned periodically. The time between cleanings will vary depending on the medium and service conditions. In general, if the voltage to the coil is correct, sluggish valve operation, excessive noise or leakage will indicate that cleaning is required. In the extreme case, faulty valve operation will occur and the valve may fail to open or close. Clean valve strainer or filter when cleaning the valve.

Preventive Maintenance
1. Keep the medium flowing through the valve as free from dirt and foreign material as possible.
2. While in service, the valve should be operated at least once a month to insure proper opening and closing.
3. Depending on the medium and service conditions, periodic inspection of internal valve parts for damage or excessive wear is recommended. Thoroughly clean all parts. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Causes of Improper Operation
1. Incorrect Pressure: Check valve pressure. Pressure to valve must be within range specified on nameplate.
2. Executive Leakage: Disassemble valve (see Maintenance) and clean all parts. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Valve Disassembly

WARNING: To prevent the possibility of personal injury or property damage, turn off electrical power, depressurize valve, and vent fluid to a safe area before servicing the valve.

1. Disassemble valve using exploded views for identification of parts.
2. Remove solenoid, see separate instructions.
3. Unscrew solenoid base sub-assembly or valve bonnet with special wrench adapter supplied in ASCO Rebuild Kit. For wrench adapter only, order No. R218-948. Remove core assembly, core spring, and solenoid base gasket from valve body. For normal maintenance on Series R263 valves it is not necessary to remove valve seat. See Figure 1 for metering or manual operator constructions.
4. For normally open construction (Figure 3) remove end cap, or manual operator, (not shown) end cap gasket, disc holder spring, and disc holder assembly.
5. All parts are now accessible to clean or replace. If parts are worn or damaged, install a complete ASCO Rebuild Kit.

Valve Reassembly
1. Use exploded views for identification, orientation and placement of parts.
2. Lubricate all gaskets with Dow Corning 111 Compound lubricant or an equivalent high-grade silicone grease.
3. For normally open construction (Figure 1), install disc holder assembly, disc holder spring, end cap gasket and end cap or manual operator. For valves with 1/8" NPT, torque end cap or manual operator to 90 ± 10 in-lbs (10.2 ± 1.1 Nm). For all other valves torque end cap or manual operator to 175 ± 25 in-lbs (19.8 ± 2.8 Nm).
4. For Series R263 apply a small amount of LOCTITE 687 or PST® pipe sealant to threads of valve seat (if removed). Follow manufacturer’s instructions for application of pipe sealant. Then install valve seat and torque to 75 ± 10 in-lbs (8.5 ± 1.1 Nm).
5. Replace solenoid base gasket, core assembly with core spring and solenoid base sub-assembly or plug/valve tube sub-assembly and valve bonnet. Note: For core assemblies with internal type core springs, install wide end of core spring in core assembly first, closed end of core spring, resides from top of core assembly.
6. For 1/8" NPT valve constructions, torque valve bonnet to 90 ± 10 in-lbs (10.2 ± 1.1 Nm). Torque solenoid base sub-assembly to 175 ± 25 in-lbs (19.8 ± 2.8 Nm).
7. Install solenoid. See separate solenoid instructions. Then make electrical hookup to solenoid.

WARNING: To prevent the possibility of personal injury or property damage, check valve for proper operation before returning to service. Also perform internal seat and external leakage tests with a nonhazardous, noncombustible fluid.

8. Restore line pressure and electrical power supply to valve.
9. After maintenance is completed, operate the valve a few times to be sure of proper operation. A metallic “click” signifies the solenoid is operating.

ORDERING INFORMATION
FOR ASCO REBUILD KITS
Parts marked with an asterisk (*) in the exploded view are supplied in Rebuild KIts.

When Ordering Rebuild Kits for ASCO valves, order the Rebuild Kit number stamped on the valve nameplate.

+ If the number of the kit is not visible, order by indicating the number of kits required, and the Catalog Number and Serial Number of the valve(s) for which they are intended.

By order of Fire Commissioner, Thomas Von Essen and pursuant to §27-4015 of the
Administrative Code, the following equipment or material may be acceptable for use provided the
conditions as outlined below are in full compliance.

Manufacturer: AirSep Corporation

Product: Portable oxygen generator for industrial use

Pertinent Code: §27-4102.d and §27-4100.d of the NYC Administrative Code

Section:

Laboratory: Canadian Standards Association

Test Report:

File #: LR83232-1 Dated: 12/30/94
File #: LR83232-5 Dated: 03/28/95
File #: CB838102329 Dated: 03/28/95

Trade Name / Model Number:

1. New Life Operating Pressure: 30 PSI
2. Reliant Operating Pressure: 30 PSI
3. AS-10 Operating Pressure: 30 PSI
4. AS-12 Operating Pressure: 30 PSI
5. AS-20 Operating Pressure: 67 PSI
6. AS-45 Operating Pressure: 67 PSI
7. AS-80 Operating Pressure: 67 PSI
8. AS-160 Operating Pressure: 67 PSI
9. AS-250 Operating Pressure: 67 PSI
10. AS-450 Operating Pressure: 67 PSI
Description: Model # AS-10, AS-12, Reliant and New Life have internal compressor. Model # AS-20, 45, 80, 160, 250, 450 are connected to shop air.

CONDITIONS OF APPROVAL:

1. Use shall be only in ventilated room and free of oil and grease. Manufacturer's safety and maintenance practices must be observed.

2. Post decals on unit cautioning against blocking gas inlet and outlet and air inlet and against using oil or grease. ASME code pressure vessel must be re-tested every five (5) years.

3. The installation shall conform to the manufacturer's recommendations and the NYC Electrical Code. The operation of this equipment with a combustible gas shall be under the supervision of a person holding a Certificate of Fitness from the Fire Department and a Fire Department permit must be obtained.

4. A permit will be required if the air compressor used to run this equipment has a receiver exceeding 30 cubic feet capacity, has a pressure gauge calibrated to greater than 100 PSI or operates over 100PSI.

5. The use of the above mentioned product and/or system shall be limited to the indicated intent and has not been acceptable for other uses or applications. All CSA. requirements and follow-up service procedures must be complied with.

6. Each equipment of a type for which a Certificate of Approval shall have been issued must have number of such certificate plainly and permanently stamped or otherwise fixed upon it by the manufacturer.

7. The Certificate of Approval will be issued upon condition that the equipment's technology does not violate any patent, trade name, trade secret or other intellectual right.

8. The Fire Department Certificate of Approval does not constitute an endorsement or recommendation of your product by the Fire Department, but is a certification that your product, as represented, meets the standards as of the date of issuance.
9. The Fire Department reserves the right to withdraw this approval at any time in the event there is a reasonable doubt that the product does not operate or perform as required by code, the conditions of this resolution or as represented in your application.

10. The Fire Department's conditions of approval shall be enumerated in the installation manuals and brochures which will be provided to buyers, users and installers.

11. As the manufacturer of this equipment/material, you should be aware that any end users who fail to comply with the condition as outlined in the acceptance will be subject to enforcement action which may include fines and imprisonment.

Any change in product original design, product name, material of construction, model number, company name or ownership of any product included on this certificate must be immediately reported to this Department in writing.

Very truly yours,

[Signature]
